                                   The present sequence, which encodes the heavy chain variable region of the human antibody (Ab) CRA2, was used in the preparation of a humanised or semi-chimeric monoclonal Ab (MAb), comprising complementarity determining regions (CDR) from a murine, anti-human high affinity immunoglobulin E (IgE) receptor, MAb. The humanised, semi-chimeric or chimeric MAb can be used to treat or prevent diseases, specifically allergies, associated with the receptor, and has very low antigenicity in humans.

```
This sequence encodes a human antife epsilon RI alpha chain antibody, produced using the method of the invention. The method is for preparing an antibody Fab fragment using the yeast Pichia pastoris as the host cell. The method can prepare an antibody Fab fragment cost efficiently
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AntiFc epsilon RI alpha chain antibody; antibody production; human; ds

                                                                                                                                                                                                                                                                              This sequence encodes a human antiFc epsilon RI alpha chain antibody, produced using the method of the invention. The method is for preparing an antibody Fab fragment using the yeast Pichia pastoris as the host cell. The method can prepare an antibody Fab fragment cost efficiently
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          280

The sequences given in AAQ68649-50 encode the light and heavy chain variable regions (VH and VL) of the humanised anti-A33 antibody of the invention. These fragments were produced by PCR using the primer sequences given in AAQ68624-48. The amplified fragments were used in the construction of vectors for the expression and secretion of the chimeric humanised A33. The amplified products were cleaved with BstBI and SplI for the light chain and HindIII and ApaI for the heavy chain. These fragments were cloned into the human kappa light chain acceptor vector, pMRRI51, and the human heavy chain, IgG1; acceptor vector, pMRRI51, and the human heavy chain. Proteins which bind the A33 antigen can be used in the diagnosis or treatment of colorectal cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               64 aagtgaagctggtggagtctggggggggggcttagtgaagcctggagggtccctgaaactct 123

particularly used to prepare single chain antibody FV fragments (scFV), potentially useful for diagnosis and treatment of cancer. The fusion polypeptide containing the specified linkers is proteolytically stable (associated with positioning of the P residue) and resistant to aggregation, while residue X improves solubility. The present sequence represents the nucleotide sequence of a A33/212 scFV fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Fusion protein; linker; linked fusion polypeptide; multichain protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Peptide linkers, linked fusion polypeptides containing the linkers and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention is directed to a novel peptide linker useful for connecting polypeptide constituents into a novel linked fusion polypeptide. The polypeptide constituents into a novel linked fusion polypeptide. The peptide linker includes at least one XP motif (where X is a charged amino acid) and includes any of these sequences (GSYSGSXPGSGSCBSTKG; GTSGSGXPGSGSCBCSTKG; or GTSGKSEGKG) to inhibit its proteolysis by subtilisin or trypsin. DNA molecules encoding fusion polypeptides, containing two polypeptides, derived from the same multichain protein of the immunoglobulin (Ig) superfamily and a peptide linker as above, are

                        This sequence encodes a linked fusion protein containing the amino acid linker of the invention. The linkers are used for connecting constituent polypeptides to form novel linked fusion polypeptides. Polypeptides derived from any protein can be connected, in particular multichain protein or protein complexes e.g. enzymes, members of the immunoglobulin superfamily, hormones, DNA-binding proteins. The linker provides fusion proteins which have greater stability and are less

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention is directed to a novel peptide linker useful for connecting polypeptide constituents into a novel linked fusion polypeptide. The peptide linker includes at least one XP motif (where X is a charged amino acid) and includes any of these sequences (GSTGSGXPGGSGEGFTG; GTSGSCXPGGCSTG; Or GSTGGKSEGKG) to inhibit its proteolysis by subtilisin or trypsin. DNA molecules encoding fusion polypeptides containing two polypeptides, derived from the same multichain protein of the immunoglobulin (Ig) superfamily and a peptide linker as above, are particularly useful for diagnosis and treatment of cancer. The fusion polypeptide containing the specified linkers is proteolytically stable (associated with positioning of the P residue) and resistant to aggregation, while residue X improves solubility. The present sequence represents the nucleotide sequence of a A33/218 scFv fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            496

The linkers are used for connecting constituent polypeptides to form novel linked fusion polypeptides. Polypeptides derived from any protein can be connected, in particular multichain protein or protein complexes e.g. enzymes, members of the immunoglobulin superfamily, hormones, DNA-binding proteins. The linker provides fusion proteins which have greater stability and are less
                                                                                                                                                                                                                Fusion protein; linker; linked fusion polypeptide; multichain protein; protein complex; antibody; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Peptide linkers, linked fusion polypeptides containing the linkers and

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 56, 1

Sequence 56, Application US/08452164A

Patent No. 5877206.

GENERAL INFORMATION.

APPLICANT: Haman, Philip R.

APPLICANT: Hollander, Italian

APPLICANT: Weiss, Martin J.

ITILE OF INVENTION: Conjugates of Methyltrithio Antitumor

ITILE OF INVENTION: Agents and Intermediates for Their Synthesis

CORRESPONDENCE ADDRESS:

ADDRESSEE: American Home Products Corporation

STREET: One Campus Drive

CITY: Parsippany

CONTRY: New Jersey

                                                                                                                                                                                                                                                                                       Sequence 3, Application US/08672176A
Patent No. 5908925
GENERAL INFORMATION:
APPLICANT: Cohen, Margo P.; Shearman, Clyde W.
TITLE OF INVENTION: Genetically Engineered Immunoglobulins with
TITLE OF INVENTION: Specificity for Glycated Albumin
NUMBER OF SEQUENCES:
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               MOLECULE TYPE: other nucleic acid
DESCRIPTION: humanized A717 heavy chain variable region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            NAME: Silver, Robert S.
REGISTRATION NUMBER: unknown
REGISTRATION NUMBER: u1042/20002
TELECHONE: 215-567-2010
TELEPHONE: 215-751-1142
INFORMATION FOR SEQ ID NO: 3:
SEQUENCE CHARACTERISTICS:
LENGTH: 360 base pairs/120 amino acid residues
TYPE: nucleic acid/amino acid residues
STRANDEDNESS: double stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 COUNTAL 19104

COMPUTER READABLE FORM:

                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                           This sequence represents a fragment of the vitaxin antibody variable heavy chair region. Vitaxin and the antibody LM609 bind selectively to integrin alphavbeta3 and can be used to inhibit binding of alphavbeta3 to a ligand and thus block integrin-mediated signal transduction. This is useful in the treatment, prevention and diagnosis of alphavbeta3-mediated disease, specifically angiogenesis and restenosis (but also e.g. (non-)immune inflammation, diabetic retinopathy, neovascular glaucoma, cancer, psorlasis, rheumatoid arthritis, macular degeneration, osteoporosis etc.). The antibodies contain non-murine framework regions so are suitable for use in humans. Bahanced types of LM609 have affinity more than 90 times greater than that of parent the parent antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Enhanced LM609 grafted antibodies exhibiting selective binding affinity to alpha(V)beta(3) integrin, useful in the diagnosis and treatment of anglogenesis, inflammatory diseases e.g. psoriasis, cancers and
integrin - and related grafted antibodies based on murine monoclonal LM609, also related nucleic acid, used to treat, prevent or diagnose

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents the LM609 antibody variable heavy chain region. LM609 and the antibody vitaxin bind selectively to integrin alphavbeta and can be used to inhibit binding of alphavbeta1 to a ligand and thus block integrin mediated signal transduction. This is useful in the treatment, prevention and diagnosis of alphavbeta3-mediated disease, specifically angiogenesis and restenosis (but also e.g. (non )immune inflammation, diabetic retinopathy, neovascular glaucoma, cancer, psoriasis, rheumatoid arthritis, macular degeneration, osteoporosis
                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                   1 QVQLVESGGGVVQPGRSLRLSCAASGFTFSSYDMSWVRQAPGKGLEWVAKVSSGGGSTYY 60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Humanised antibody, Vitaxin, that binds selectively to alphaVbeta3 integrin - and related grafted antibodies based on murine monoclonal LM609, also related nucleic acid, used to treat, prevent or diagnose
fragments can be used in the diagnosis and treatment of alphaVbeta_3-mediated diseases such as angiogenesis, inflammatory diseases (such as psoriaais and chronic articular rheumatism), disorders associated with inappropriate or inopportune invasion of vessels (such as diabetic retinopathy, neovascular glaucoma and cancer disorders such as tumours and Kaposi's sarcoma), retinal diseases (such as macular degeneration), restenosis and

                                                The present sequence, the heavy chain variable region of the human actiondy (Ab) CRA2, was used in the preparation of a humanised or semi-chimeric monoclonal Ab (MAD), comprising complementarity determining regions (CDR) from a murine, anti-human high affinity immunoglobulin E (IGE) receptor, MAD. The humanised, semi-chimeric or chimeric MAD can be used to treat or prevent diseases, specifically allergies, associated with the receptor, and has very low antigenicity in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Complementarity determining region; CDR; murine; mouse; human; high affinity; immunoglobulin E; receptor; monoclonal antibody; IgE; MAb; heavy chain; variable region; humanised; semi-chimeric;

This sequence represents a human antific epsilon RI alpha chain antibody, produced using the method of the invention. The method is for preparing an antibody Fab fragment using the yeast Pichia pastoris as the host cell. The method can prepare an antibody Fab fragment cost efficiently
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 QVQLVESGGGVVQPGRSLRLSCAASGFTFSSYDMSWVRQAPGKGLEWVAKVSSGGGSTYY 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents a human antific epsilon RI alpha chain antibody, produced using the method of the invention. The method is for preparing an antibody Fab fragment using the yeast Pichia pastoris as the host cell. The method can prepare an antibody Fab fragment cost efficiently
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     20 evqlvesggglvqpggslrlscaasgftfstypmswvrqapgkglewvafisnrggstyy 79

This sequence represents the light chain V kappa region of murine monoclonal antibody LM609. LM609 is directed to integrin alpha-v beta-3. It selectively promotes apoptosis of vascular cells that have been stimulated to undergo angiogenesis, making it a tool for cancer diagnosis and therapy. The invention provides humanised antibodies, especially humanised LM609. In such humanized antibodies, a light chain CDR from a mouse antibody such as LM609 is grafted onto a human light chain, and a heavy chain CDR from a mouse antibody is grafted onto a human antibody heavy chain to produce libraries from which a humanised murine antibody having the desired specificity is selected. By preserving the original CDR sequences such as the HCDR3 and LCDR3 sequences of LM609 (see AAX06371-72), the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Chimeric; antibody; human parathormone related peptide; hPTRP; mouse; L chain; H chain; hypercalcaemia; cancer; malignant lymphoma; CDR; hypophosphaemia; pathogen; vitamin D resistance; V region; C region;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                This sequence represents the heavy chain variable region of murine monoclonal antibody LM609. LM609 is directed to integrin alpha-v beta-3. It selectively promotes apoptosis of vascular cells that have been stimulated to undergo angiogenesis, making it a tool for cancer diagnosis and therapy. The invention provides humanised antibodies, especially humanised LM609. In such humanized antibodies, a light chain CDR from a mouse antibody such as LM609 is grafted onto a human light chain, and a heavy chain CDR from a mouse antibody is grafted onto a human antibody heavy chain to produce libraries from which a humanised murine antibody having the desired specificity is selected. By preserving the original CDR sequences such as the HCDR3 and LCDR3 sequences of LM609 (see AAY06371-72), the humanisation strategy ensures epitope conservation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A composition for the treatment of hypercalcenic crisis. active component a substance which inhibits the binding of parathyroid hormone related peptide (PHHP) to its receptor. The inhibitor is used for the treatment of hypercalcemic crisis, such as that associated with a malignant tumour.
                                                                       The present invention describes compositions for the treatment of cachexia containing a substance which inhibits the binding of a parathyroid hormone related peptide (PTHTP) to its receptor, as an active component. This substance may be an antagonist to the receptor, or an antibody (preferably monoclonal) or antibody fragment, recognising PTHTP. The antibody is preferably humanised or chimeric. The present invention also describes a humanised antibody prepared by hybridoma 23-57-137-1 (FERM BP-5631). The composition is used for the treatment of cachexia arising in connection with diseases such as cancer, thereby improving the quality of life of the patient. The present sequence represents a human antibody heavy chain from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method of treatment of hypercalcemic crisis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Treatment of hypercalcemic crisis with a substance inhibiting binding of parathyroid hormone related peptide to its receptor
                                                                                                                                                                                                                                                                                                                                                                                  1 QVQLVESGGGVVQPGRSLRLSCAASGFTFSSYDMSWVRQAPGKGLEWVAKVSSGGGSTYY 60
